Ecosystem Strateg...	SECTION USED FOR EXECUTIVE BRIEFING SUMMARY This section should provide a concise summary of the entire account plan, incorporating insights from the Customer Initiatives, Scorecard, Whitespace Map, and Account Map. It serves as a quick reference for onboarding executives as well as other extended team members to the account. Start by articulating the value statement for the customer, using the Value Statement model: Issue: Describe the customer's key business goals or challenges, linking them to their initiatives. Action: Explain how we can uniquely address these issues, highlighting our distinct capabilities. Value: Answer the "So what?" question by clearly articulating the benefits our actions will deliver, using the customer's own terms. For more details on crafting a value statement, refer to the "Building Competitive Advantage" resources here.

You can provide in the notes section a brief summary of why you have selected the answer. Description of the levels: 0. No Adoption / No Entitlement: The customer is net new for RH with no subscriptions or other entitlements (e.g. bought through hyperscalers) purchased in past 3 years or more. Initial / Ad-Hoc: At this stage, RH software is not yet delivering significant business outcomes. It may be in early trials or pilot phases, with minimal organizational impact (for example: basic installation or trial phase, limited or no formal training, no defined processes for usage); select this option also if RH is not yet selling to this customer Basic Adoption / Developing: software is delivering some business benefits in terms of cost savings or basic operational improvements, but its adoption is still limited to specific teams or projects (for example: using some features / tools consistently, usage limited to isolated teams or smaller projects, basic integrations with existing infrastructure on-prem/cloud) Advanced Usage / Operational: RH software is being used more broadly, impacting several areas of the business, leading to improved operational efficiency and clear ROI. It's seen as a key tool in day-to-day operations (for example: multiple teams or departments use the software consistently, more features are leveraged, and some automated, full integration into core IT processes, metrics and monitoring are set up to evaluate performance) Strategic Alignment / Optimized: RH software aligned with strategic goals and driving significant value, enabling new business models or transforming key areas. Adoption is deepening, but there may still be areas for expansion across the organization (for example: RH software is critical to core operations across the IT organization, sophisticated use of automation, continuous monitoring and optimization of IT and infrastructure, advanced integrations across cloud/on-prem or hybrid models) Innovator / Evangelist: Customer views RH software as essential to their business's success. It's deeply integrated, supports innovation, and drives competitive advantage. The organization acts as an advocate, and RH software fully aligned with long-term business goals (e.g. uses RH software to gain competitive advantages and drive innovation, contributes back to RH or community, case studies, partnerships, acts as a reference for RH, participating in conferences, webinars, participates in beta programs and experiments with new features) Additional resources		

For your customer's entitlements, are they on track to adopt all quantities?

Does the customer have a Committed Spend ...	Help THIS SECTION IS USED FOR THE EXECUTIVE SUMMARY AND FOR ACCOUNT REVIEW WITH CUSTOMERS AND PARTNERS Copy and answer these three questions in the Executive Summary section. This section is customer-facing (or partner-facing) and should be created with, and shared with, the customer (or partner) to verify our understanding of their business. Focus on the customer's perspective and their business, not Red Hat's. What are the customer's top business objectives? What are the top challenges that put the customer's ability to achieve their business objectives at risk? What are the key factors influencing the customer's business (e.g., market, industry, competition, economic situation)? This section flows into the Executive Summary: Customer Success Overview, which specifically focuses on the interaction between the customer and Red Hat. Please ensure that both sections are aligned and build on each other. Additional resources	

Customer Business Objectives, Challenges & Key Initiatives

Answer Notes **Help**

This section provides space to dive deeper into the details of the customer's business, including their objectives, needs, and challenges, as well as how these are supported by IT initiatives. Please address the following questions:

Top Business Objectives:

What are the customer's top business objectives?

How are these objectives supported by the customer's initiatives?

How are these initiatives supported by IT, and how are they funded?

What is the funding for the initiatives, and what is the decision-making process for determining which initiatives will be funded?

What is the customer's personnel situation, and how are they ensuring they have the necessary resources to support the IT initiatives?

Top Business Challenges:

What are the top challenges the customer faces over the next three years (according to their own perspective)?

What are the potential impacts for the customer if these challenges remain unresolved?

How are these challenges being addressed by IT initiatives, and how are those initiatives funded?

This section serves as an introduction to the "Initiatives" section of the account plan, where you will connect the customer's IT initiatives with current and potential opportunities.

Customer's Market & Competition			
<	Answer	Notes	Help
	This section focuses on a deeper dive into the factors influencing the customer's environment, including their industry, market conditions, competition, and more. Please address the following questions: What services or products do they provide to the market? What is their business model (how do they generate revenue and achieve their objectives)? How do they differentiate themselves from the competition (is technology a differentiator)? Who are the customer's main competitors, and what is the customer's market position? What trends are impacting the customer's industry? What economic, political, or regulatory trends are affecting the customer's business? For this section, consult Finlistics and look for Red Hat success stories and specialized content on industry verticals in RHCC. Additional resources		✓ ✓

How would you categorize the customer's overall approach to adopting digital innovations?			
<	Answer	Notes	Help
	THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS Evaluate which of the following best describes the customer's approach to adopting innovation, with a special focus on digital, IT, or AI-supported innovation. Please note that this description should reflect the customer's approach independently of their current status with Red Hat: 1. Laggard: Characterized by a traditional and conservative approach; these companies are the last to adopt new technologies. 2. Late Majority: Characterized by skepticism towards change, adopting innovations only after they have been widely accepted and implemented within the industry or market. 3. Early Majority: Characterized by adopting new innovations ahead of the average company, though they require evidence of the innovation's effectiveness before doing so. 4. Early Adopter: Characterized by a comfort with change and a willingness to adopt new ideas and technologies. 5. Innovator: Characterized by a desire to be the first to implement innovations; these companies are digital leaders. Please provide a brief comment in the notes section explaining why you chose a particular answer Additional resources		✓ Upcoming <i>No next st</i> ✓ Past Activ <i>No past ac</i> <i>here.</i>

What is the customer's level of cloud adoption?	
<	Answer Notes Help
vi...	THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS Please select the level that best corresponds to the overall level of cloud adoption by the customer. You can provide a brief summary in the notes section explaining why you selected that answer. Description of the Levels: 1. Land/Initial: The customer is learning about and understanding cloud technologies to begin an adoption or migration plan. Currently, only a very low percentage of the customer's workloads are running in the cloud. 2. Adopt/Developing: The customer is leveraging the cloud to run some applications in production. They have selected certain workloads to run in the cloud and may be considering adding more; however, the majority of their workloads are not yet in the cloud. 3. Expand/Operational: The customer is utilizing the cloud to run business-critical applications in production. 4. Refactor/Optimize: The customer is focusing on FinOps and optimizing overall cloud usage, with the majority of their workloads running in the cloud. 0.No cloud adoption: The customer does not have any cloud deployments or a roadmap for adoption. What actions can you take based on the customer's level of cloud adoption? Land/Initial: The objective should be to understand and support the customer's cloud adoption plan and roadmap to leverage business value. Explore the customer's cloud usage policy, identify their preferred cloud provider, and assess any committed spend contracts and non-Red Hat cloud consumption or solutions. Adopt/Developing: The objective should be to accelerate the customer's time-to-value and secure business outcomes by identifying incremental cloud workloads. Expand/Operational: The objective should be to plan for the expansion of the customer's cloud adoption success and identify new solutions for cloud deployment. Refactor/Optimize: The objective should be to maximize the value and impact of the customer's investment. Propose Reserved Instances to the customer and secure additional monthly consumption. No cloud adoption: Understand the reasons for not moving to the cloud. Position Red Hat as a company that enables transitions between on-premise and cloud while keeping options open. Contact the Cloud Ecosystem team for further support. Additional resources

Who are the key incumbent ISV Partners?

Answer

Notes

Help

Please list the key incumbent Independent Software Vendors (ISVs) associated with the customer. Ensure that this section aligns with the question in the Tech Sales part of the plan focused on the customer's "Key Customer Applications and Workloads." Ideally, this section should identify the ISV partners that are powering the customer's key applications and workloads.

[Additional resources](#)

Who are the key hardware & OEM partners of the customer?

Answer Notes **Help**

THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS

Please provide the names of any relevant hardware and OEM (Original Equipment Manufacturer) partners for the customer. Please add any partners from this category that is not in the multiple choice selection by marking "Others" and state their names. You can provide more information about the partner's role in the customer's ecosystem and about our relationship in the Notes of this question. Please connect the answer to this question to the Hardware & Storage question in the Technical Landscape section.

Executive Summary: Key Stakeholders Engagement & Marketing Strategy

Answer

Notes

Help

THIS SECTION IS USED FOR EXECUTIVE SUMMARY

Provide a brief executive summary of the account's ambitions and goals, our relationships with key stakeholders, and our account-specific marketing and executive engagement strategy. Highlight the marketing priorities and the outcomes we aim to achieve, focusing on how we will elevate the level of contacts Red Hat has with the customer.

This section should also be used to include any executive requests, as it will be part of the documents used to brief executives prior to customer engagements.

Must haves:

- If the customer is going to RH Summit, MWC or Summit Connect, you need to summarize here how this supports your account strategy, what outcomes are you intending to achieve and who are the personas you are targeting (don't forget to have them also in your account map)
- If the customer is participating on EBC or you are considering it, summarize here the goals of such participation
- Summarize your strategy of growing the network of influence within this account leveraging tools and relationships (incl. partners) available

[Additional resources](#)

What is our current level of relationships with the key stakeholders of the customer?

Answer Notes **Help**

THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS

Please select the option that best describes our current overall relationship with the key stakeholders. To determine the appropriate level, you can use the Engagement Dashboard (note: not available for countries not using [People.ai](#) in EMEA) and the Account Map to assess our outreach within the customer's organizational hierarchy and our presence across multiple business units.

Descriptions of each level are as follows:

1. **Limited:** Surface-level interactions, mostly confined to a single business unit, with low to mid-level contacts.
2. **Engaged:** Regular communication with mid-level stakeholders and interactions across a few lines of business.
3. **Targeted:** Initial connections with C-level executives, with engagement focused on specific areas or projects but not yet broad or consistent across the organization.
4. **Strategic:** Strong, direct connections with C-level executives, with regular interactions spanning multiple lines of business.

Relationship & Marketing Strategy

Answer Notes **Help**

1. Executive Engagement & Journey

Engagement Strategy: Define key stakeholders and identify relationship gaps. Use the [Gemini Gem](#) for Executive research.

Visuals & Files: Attach the Executive Stakeholder Journey map. **For ABM accounts**, include screenshots of the flight plan (slide 4.2) and link the full ABM plan in the Files section.

2. Strategy Activation Prompts

Use these questions to identify the right Red Hat programs to reach executives, strengthen champion ties, re-engage stakeholders, and differentiate from competitors.

For Recognition: Who would benefit from the spotlight? Offer Customer Reference or speaking opportunities like Summit Connects.

For Trajectory: Which executive relationship is critical? Leverage Executive Sponsors or Segment/Geo Leaders for outreach.

For Blockers: Who is the skeptic? Invite them to the EBC to engage with product and partner leaders on roadmaps and long-term vision.

For Talent Needs: Who is hiring? Use References to help them attract talent, solving a customer problem rather than asking a favor.

For Tech Champions: Who wants engineering access? Use EBCs for tech exploration or CXA Success Days for peer networking and technical use-case sharing.

3. Red Hat Marketing Toolkit

Strategic Advisory Board (SAB)

Executive Sponsorship

Executive Briefing Center (EBC)

CXA Success Days

References & Peer Reviews

RHLS Influencers

Use the [customer assessment tool](#) to identify the right marketing strategy

Help

The answers to the TDP questions help us understand the customer's operating system landscape. These questions help reveal their platform choices, strategy, tools, and workloads so you can identify the right Red Hat value and expansion opportunities.

Please describe:

Current State – What's in place today?

1. What major operating systems and distributions are in use, both on-premises and in the cloud?
2. What key workloads run on the OS platforms?
(SAP, databases, AI/ML, web apps, virtualization, containers, edge, internal apps.)
3. What systems management, automation & compliance tools are currently in use?
4. Which competitors are present (Ubuntu/Canonical, Rocky, SUSE, Oracle Linux, Windows Server)?

Future State (within next 12 months)

5. What is their linux strategy?

Action Plan

6. What value proposition/s and actions are planned to secure and increase expansion?

Server and Cloud Operating System TDP THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. Select the answer that best represents the customer's maturity with Red Hat Enterprise Linux (RHEL) for the Server/Cloud OS TDP. Choose Level 0 only if the customer has not purchased any entitlements. If the customer has purchased entitlements but has minimal or no usage, select Level 1. 0. No Entitlement The customer has neither purchased nor used RHEL. There is no known deployment or usage of RHEL in their environment. They may use a homegrown, open source, or competitor's Linux operating system. 1. Initial The customer has purchased RHEL, but usage is limited, isolated, or exploratory. RHEL may coexist with multiple other Linux distributions, lacking clear standardization. Administrators rely mostly on general Linux skills without formal RHEL training or certification. There is minimal tracking of performance or availability metrics specific to RHEL, and limited awareness of the unique benefits provided by Red Hat's solution. 2. Developing RHEL is the standard OS for a small set of critical workloads, typically driven by ISV certifications or specific application requirements. Operations teams track basic metrics such as availability and uptime for these workloads; Red Hat Insights might be partially enabled. System administrators have broad Linux skills but limited RHEL-specific expertise or formal training. 3. Operationalized RHEL is broadly adopted as the foundational OS for all mission-critical workloads. IT leadership explicitly values RHEL for reliability, stability, and security. Red Hat Insights is actively used for identifying compliance, performance, and security issues, and proactive monitoring of these systems is standard practice. Staff are encouraged to complete formal RHEL training, with key administrators actively pursuing RHCSA certification. 4. Optimizing IT leadership actively promotes a "RHEL-first" strategy, making RHEL the preferred OS for all Linux workloads within the organization. Tools such as Insights, Satellite, Ansible, and Cockpit are consistently used for proactive compliance remediation, automated performance tuning, and streamlined operational efficiency. RHCE certifications are increasingly common among administrators, enhancing the internal expertise available to optimize the RHEL environment continuously. 5. Innovator RHEL is the dominant, strategic OS choice across the organization's entire hybrid cloud environment (on-premise, cloud, edge). Advanced tools (Insights, Satellite, Ansible, Image Builder, PCP, etc.) are used extensively to proactively optimize performance, costs, security, and availability. Metrics from these tools are regularly reviewed by Operations and IT leadership. Key administrators hold advanced RHCA certifications, lead internal Communities of Practice, and actively share RHEL best practices, positioning RHEL as an essential driver of innovation and operational excellence. Virtualization TDP		
	< Answer Notes Help	
	The answers to the TDP questions help us understand how the customer runs and manages virtualized environments. The question is intended to uncover technologies, workloads, strategy and any constraints, helping to position Red Hat and drive expansion in this area. Detail the customer's choice of virtualization technologies. Please describe: Current State – What’s in place today? 1. What virtualisation tech are currently in use (VMware, Hyper-V, KVM, etc.)? 2. What key workloads are currently running in virtualized environments? 3. What security constraints or guidelines exists within their infrastructure? Future State (within next 12 months) 4. What is the customer's virtualization strategy, (are they considering migration)? 5. Who are our main competitors in this space? Action Plan 6. What value proposition and actions are planned to secure and increase RedHat expansion in this TDP? Account planning activities & best practices

THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. Select the option that best represents your customer's maturity with Red Hat OpenShift Virtualization and related virtualization management capabilities. Choose Level 0 only if the customer has no entitlements for Red Hat's virtualization tools and management solutions. If the customer has purchased OpenShift Virtualization but has minimal or no usage, select Level 1. 0. No Entitlement The customer does not have an active entitlement for Red Hat OpenShift Virtualization or related virtualization management solutions. They have neither purchased nor deployed these tools, and there is no known usage in their environment. They may be using traditional hypervisors or other third-party virtualization solutions independently. 1. Initial Virtualization is used tactically for basic server consolidation, with VM provisioning and management being manual or minimally automated. Teams have limited skills specific to modern virtualization, relying heavily on vendor support. Performance metrics are not formally tracked. The technology is perceived almost exclusively as a cost-saving measure rather than a strategic capability. 2. Developing The customer has established standardized virtualization processes and uses centralized management with basic automation. Teams have foundational knowledge of the platform and are using the Migration Toolkit for Virtualization (MTV). Some members may be taking introductory training like DO316 (Managing Virtual Machines with Red Hat OpenShift Virtualization). Performance monitoring is in place for operational efficiency, but virtualization is not yet fully integrated into strategic IT planning due to lingering concerns about complexity. 3. Operationalized Virtualization is treated as a service, with a strong focus on end-to-end automation, self-service capabilities, and GitOps-enabled workflows. Teams are proficient in using OpenShift, Ansible, and policy-based automation to manage both VMs and containers on a unified platform, with key staff holding DO280 (Red Hat OpenShift Administration II) or equivalent skills. Virtualization is now viewed as a strategic and integral part of IT efficiency and modernization efforts, with strong internal advocacy. 4. Optimizing Virtualization is a core, seamlessly integrated component of the customer's hybrid cloud strategy, supporting advanced security, governance, and FinOps. Teams are highly proficient in automating the full VM lifecycle, including migrations and workload optimization, often holding advanced certifications like DO380 (Red Hat OpenShift Administration III: Scaling Kubernetes Deployments in the Enterprise). Complex deployments are fully automated, and executive sponsors actively align the platform's capabilities with broader hybrid-cloud initiatives. 5. Innovator The platform is intelligent and self-managing, leveraging AIOps for predictive analytics, anomaly detection, and automated remediation to minimize Mean Time To Recovery (MTTR). Virtualization has reached maximum operational efficiency, freeing IT staff from routine management to focus on higher-value innovation. Internal thought leaders with top-tier certifications (RHCA) actively shape virtualization best practices and collaborate with Red Hat to drive future product innovation.		Up No t Pat No g here

Help

The answers to the TDP questions help us understand how the customer runs and manages containers today. These questions help identify their platforms, security needs, and workload plans so you can position the right Red Hat value and expansion opportunities.

Please describe:

Current State – What's in place today?

1. What container and Kubernetes platforms are currently in use (public cloud, on-premises, or third-party distributions)?
2. What management, lifecycle or governance tools are in use for their container platforms?
3. What security models, compliance standards or constraints apply to containerized workloads (if known)?
4. What key workloads are containerized today?

Future State (within next 12 months)

5. What is the customer's containerization strategy, workloads and where, on-prem, public or hybrid cloud?
6. What workloads are planned for future container adoption?

Action Plan

7. What value proposition and actions are planned to secure and increase Red Hat expansion in this TDP?

[Account planning activities & best practices](#)

Approvals Is this account plan ready for the sign off by the... Do you approve this account plan? To be compl...	THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. Select the answer that best represents the customer's maturity with Red Hat OpenShift (self-managed or managed) for the Container Management TDP. Choose Level 0 only if the customer has not purchased OpenShift and holds no entitlements. If the customer has purchased OpenShift but has minimal or no usage, select Level 1. 0. No Entitlementment The customer does not have an active entitlement for Red Hat OpenShift (self-managed or managed). They have not purchased or deployed OpenShift, and there is no known usage of Red Hat's container platform in their environment. They may be using upstream Kubernetes, a competitor's platform, or homegrown solutions. 1. Initial The customer has purchased Red Hat OpenShift, but usage is minimal, fragmented, or in an exploratory phase. Deployments are typically limited to development or test environments and managed manually. Teams have little to no formal experience with container-native operations and often rely on external support. Foundational training, such as DO180, has not been completed. OpenShift is not integrated into enterprise tooling, and no platform-level KPIs are tracked. It is generally viewed as complex or experimental. 2. Developing OpenShift supports limited production deployments of non-critical applications. Early-stage container-native practices, such as basic GitOps workflows, are emerging but not yet standardized across teams. Teams are starting to implement observability, tracking foundational metrics like latency, traffic, and error rates, though most Day 2 operations remain manual and unstructured. Foundational container skills are emerging, with some team members completing DO180-level training. However, platform adoption remains tactical, with minimal executive sponsorship or awareness. 3. Operationalized OpenShift is widely adopted as the standard platform for production workloads, owned by a dedicated platform team and integrated into organizational modernization strategies. The operational focus shifts toward reliability, employing consistent GitOps practices, automated CI/CD pipelines, and active performance optimization based on observability insights. Teams are proficient in managing clusters, leveraging advanced features such as Operators, Quotas, and multi-tenancy. Key staff hold DO280 and EX280 or equivalent certifications, driving deeper internal enablement. 4. Optimizing OpenShift is fully embedded within enterprise IT, typically structured as a robust Internal Developer Platform (IDP), providing self-service application delivery capabilities to developer teams. Emphasis is placed on ensuring platform stability, leveraging advanced capabilities such as Red Hat Advanced Cluster Management (ACM) for Kubernetes to automate governance, enforce policies, and manage consistency across hybrid clusters. Teams possess advanced hybrid orchestration and automation skills, demonstrated through certifications such as EX380. Strong collaboration exists between platform and application teams, supported by shared metrics and clearly defined KPIs. 5. Innovator OpenShift serves as a strategic, core enabler of digital transformation, supporting dynamic orchestration and secure management of business-critical workloads across hybrid cloud environments (on-premises, public cloud, and edge). Operational excellence is achieved by prioritizing rapid Mean Time To Recovery (MTTR) through automated self-healing infrastructure, policy-as-code governance, and sophisticated fleet-wide automation.

THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. Select the option that best represents your customer's maturity with Red Hat OpenShift and its integrated developer services for the Application Platform TDP. Choose Level 0 only if the customer has no entitlements for Red Hat's application development and deployment tools. If the customer has purchased OpenShift but has minimal or no usage of its developer services, select Level 1. 0. No Entitlement The customer does not have an active entitlement for Red Hat OpenShift Application Services or other developer-focused offerings. They have neither purchased nor deployed Red Hat's integrated application build and deployment tooling. There is no known usage within their environment, although they may be leveraging homegrown, third-party, or open source CI/CD tools. 1. Initial OpenShift usage is limited to experimentation or non-production (dev/test) environments, often used only as a container runtime for apps built elsewhere. Application teams lack experience in cloud-native development and have not completed formal training (e.g., DO188). No KPIs or developer performance metrics are in place. The platform is perceived as complex or experimental and lacks executive sponsorship. 2. Developing The customer has begun standardizing on OpenShift for select production workloads. Teams are experimenting with Red Hat build tools (e.g., S2I, Shipwright) and early-stage CI/CD integration. The focus is on Automation, with Deployment Frequency tracked as a leading developer performance metric. Foundational skills are forming, with teams beginning DO188 training. While internal value is growing, adoption remains tactical and not widely endorsed by leadership. 3. Operationalized OpenShift is used in production across multiple teams, with consistent CI/CD workflows implemented via OpenShift Pipelines and GitOps. RHADS capabilities are in active use, and the platform is managed as a shared developer service. Lead Time for Change becomes a key performance metric. Developer teams are proficient in cloud-native patterns, with many completing EX188. Executive support is solidifying, and the platform is considered strategic. 4. Optimizing A self-service Internal Developer Platform (IDP) is in place, with scaled adoption of multiple RHADS components including Dev Spaces, Service Mesh, and Serverless. Developer workflows are standardized, and automation is enforced through policy. The Change Failure Rate is actively tracked and improving. Executive sponsors align the platform with broader transformation goals. Teams demonstrate advanced skills and certification (e.g., EX288) is common. 5. Innovator OpenShift and Red Hat Advanced Developer Suite (RHADS) are fully embedded as a Platform-as-a-Product, supporting business-critical applications across hybrid and multi-cloud environments. AI-enhanced workflows and integrated observability enable rapid recovery, with minimized MTTR and predictive incident response. Internal champions shape platform direction, contribute to RH communities, and influence best practices across the industry.	Up No n Past No pi here,

THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. Select the answer that best represents the customer's maturity with Red Hat Ansible Automation Platform (AAP) for the Automation TDP. Choose Level 0 only if the customer has not purchased AAP and holds no entitlements. If the customer has purchased AAP but has minimal or no usage, select Level 1. 0. No Entitlementment The customer does not have an active entitlement for Red Hat Ansible Automation Platform. There is no evidence of AAP usage in their environment, and they have not purchased or deployed the platform for any automation use cases. They may use homegrown tools or third-party solutions such as Chef, Puppet, or standalone scripts. 1. Initial The customer has purchased Ansible Automation Platform, but usage is minimal or isolated. Automation efforts consist of ungoverned, ad-hoc scripts often maintained by a small number of individuals without formal training. Legacy tools (e.g., Chef, Puppet) or internally developed scripts may still be dominant. There is no unified automation strategy, no integration with systems of record (e.g., ITSM tools), and no defined KPIs to measure impact. Automation is viewed as tactical or experimental. 2. Developing Ansible is introduced for specific, targeted tasks (e.g., patching, provisioning) by a small group or an early-stage Community of Practice, typically within a single IT domain. Early automation wins are being documented and shared internally to build momentum, though overall adoption remains tactical without formal executive backing. Teams have begun foundational training (e.g., Ansible Basics, DO374) and are developing skills, but workflows and processes are not yet fully automated or integrated enterprise-wide. 3. Operationalized Ansible Automation Platform is broadly deployed, providing standardized automation across multiple IT domains. Features like automation controller, analytics, and validated content are consistently utilized. Day 2 operations (compliance, remediation, updates) are automated at scale and integrated with enterprise ITSM platforms like ServiceNow, reflecting a proactive operational approach. Staff proficiency is strong, demonstrated by completion of certifications such as EX374 (Red Hat Certified Specialist in Developing Automation with Ansible Automation Platform). A formal Automation Guild or Center of Excellence (CoE) is actively guiding enablement and governance. 4. Optimizing Automation is established as a strategic, shared service with clear executive sponsorship, cross-domain collaboration, and dedicated funding. Advanced Ansible capabilities—including Event-Driven Ansible, automation mesh, and validated content—are fully integrated into critical production workflows across hybrid environments. Automation outcomes are measured against business KPIs such as Mean Time To Recovery (MTTR), incident reduction, and resource efficiency. A mature CoE oversees governance, standards, and prioritization. Staff actively pursue advanced certifications like EX447 (Red Hat Certified Specialist in Ansible Network Automation), ensuring deep domain-specific expertise and continuous improvement. 5. Innovator Automation is deeply embedded in organizational culture and strategic decision-making, recognized as a fundamental competitive advantage driving innovation and operational resilience. Ansible orchestrates complex workflows dynamically across the entire hybrid cloud landscape (data center, public cloud, edge) using sophisticated event-driven triggers and AI-driven insights.

OUTLINE		Answer	Notes
			Help
Virtualization TDP Maturity		The answers to the TDP questions help us understand what customer is planning and how they are operating AI. These questions clarify their use cases, data needs, and platform choices, helping you identify where Red Hat can support secure and scale AI adoption. Please describe: Current State – What's in place today? 1. What AI or ML use cases are currently implemented or being implemented? 2. How does the customer train, manage, deploy, and operationalize their AI models? 3. What AI workloads or applications are currently running? Future State (within next 12 months) 4. What types of data will be used to train or fine-tune AI models, and how is data governance managed? 5. What criteria does the customer use to select AI platforms (e.g., data privacy, IP protection, vendor lock-in concerns)? 6. what is the roadmap for scaling AI? Action Plan 7. What value proposition and actions are planned to secure and increase Red Hat expansion in this TDP? Account planning activities & best practices

Select the answer that best represents the customer's maturity with Red Hat-supported AI/ML platforms and practices for the AI TDP. Choose Level 0 only if the customer has not purchased any entitlements. If the customer has purchased an AI platform subscription but has minimal or no usage, select Level 1. 0. No Entitlement The customer does not have an active entitlement for any Red Hat-supported AI solution. They have neither purchased nor deployed Red Hat products for AI/ML, and there is no known usage in their environment. They may use open-source tools or third-party AI platforms independently. 1. Initial AI initiatives are exploratory and fragmented, often driven by individual data scientists experimenting on unmanaged infrastructure. Use of generative AI is limited to public, third-party SaaS tools, with no enterprise-wide visibility or integration. There is no AI strategy, governance, or standard model management in place. AI is not aligned to IT or business objectives and is typically seen as hype, a risk, or a non-priority by leadership. 2. Developing The organization has identified at least one targeted AI use case and is actively planning a Proof-of-Concept (PoC), usually within a single team or department. Basic platform capabilities, such as containerized development environments or GPU acceleration, are being evaluated. Teams are building foundational AI skills, engaging with Red Hat resources, or participating in workshops to define clear PoC success criteria. However, model development remains informal, lacking reproducibility, enterprise integration, and formal observability. Leadership buy-in and dedicated budgets for AI are not yet established. 3. Operationalized A formal AI Proof-of-Concept is actively deployed on managed, shared enterprise infrastructure, with deliberate attention to model reproducibility, version control, and performance monitoring. Cross-functional collaboration among data science, infrastructure, and operations teams is emerging, with initial MLOps pipelines being developed for standardized model deployment. Early success from the PoC is generating visibility and gaining initial leadership recognition, establishing AI as a valuable tool for solving specific, recognized business problems. 4. Optimizing AI is deeply integrated into enterprise workflows, supported by standardized, automated MLOps pipelines managed by a centralized platform team. An established AI Center of Excellence (CoE) provides structured governance, enforcing robust frameworks for model security, compliance, and lifecycle management. Leadership fully endorses AI initiatives, recognizing AI as a competitive differentiator, with platform usage consistently measured against defined KPIs (e.g., training efficiency, inference cost, platform availability). 5. Innovator AI serves as a critical driver of business innovation and competitive advantage. End-to-end model development, deployment, and monitoring are fully automated and delivered via self-service workflows used extensively across business units. Advanced orchestration, automation, and event-driven operations enable resilient, scalable AI applications across data center, public cloud, and edge infrastructure. The organization has strong internal AI thought leaders who actively shape industry best practices, partner closely with Red Hat on innovative initiatives, and directly influence executive-level AI strategy and investment decisions through continuous performance monitoring and metric-driven insights. </td><td> Upcoming No new Past No past here. </td></tr>	THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. AI is not aligned to IT or business objectives and is typically seen as hype, a risk, or a non-priority by leadership. 2. Developing The organization has identified at least one targeted AI use case and is actively planning a Proof-of-Concept (PoC), usually within a single team or department. Basic platform capabilities, such as containerized development environments or GPU acceleration, are being evaluated. Teams are building foundational AI skills, engaging with Red Hat resources, or participating in workshops to define clear PoC success criteria. However, model development remains informal, lacking reproducibility, enterprise integration, and formal observability. Leadership buy-in and dedicated budgets for AI are not yet established. 3. Operationalized A formal AI Proof-of-Concept is actively deployed on managed, shared enterprise infrastructure, with deliberate attention to model reproducibility, version control, and performance monitoring. Cross-functional collaboration among data science, infrastructure, and operations teams is emerging, with initial MLOps pipelines being developed for standardized model deployment. Early success from the PoC is generating visibility and gaining initial leadership recognition, establishing AI as a valuable tool for solving specific, recognized business problems. 4. Optimizing AI is deeply integrated into enterprise workflows, supported by standardized, automated MLOps pipelines managed by a centralized platform team. An established AI Center of Excellence (CoE) provides structured governance, enforcing robust frameworks for model security, compliance, and lifecycle management. Leadership fully endorses AI initiatives, recognizing AI as a competitive differentiator, with platform usage consistently measured against defined KPIs (e.g., training efficiency, inference cost, platform availability). 5. Innovator AI serves as a critical driver of business innovation and competitive advantage. End-to-end model development, deployment, and monitoring are fully automated and delivered via self-service workflows used extensively across business units. Advanced orchestration, automation, and event-driven operations enable resilient, scalable AI applications across data center, public cloud, and edge infrastructure. The organization has strong internal AI thought leaders who actively shape industry best practices, partner closely with Red Hat on innovative initiatives, and directly influence executive-level AI strategy and investment decisions through continuous performance monitoring and metric-driven insights. Key customer applications and workloads

Answer Notes **Help**

List the key applications and workloads that matter most to the customer's business. For each application, capture:

1. Application Name

- a) The business purpose(what it supports)
- b) How it is deployed (On-prem, Cloud, Hybrid cloud)
- c) Development (Inhouse, off-the-shelf, 3rd party, ISV)

This view helps map adoption maturity for each TDP to the applications that run on top of it.

Check the “Ecosystem Strategy” section for ISV vendors and keep the information consistent.

Hardware & Storage

Answer Notes **Help**

Describe the **customer's primary hardware and storage landscape**. This helps us understand the foundation for the TDPs and where modernization or consolidation can drive adoption and growth.

- 1. Which hardware vendors do the customer primarily use for servers and infrastructure?
- 2. What storage solutions or platforms are currently deployed?
- 3. Which partners or OEMs supply their storage and hardware (integrated systems, certified platforms)?
- 4. How are storage workloads allocated/used on-prem, cloud, or hybrid?
- 5. Are there upcoming refresh cycles, consolidation plans, or modernization initiatives related to hardware or storage?

Make sure this aligns with the **Hardware & OEM partner information in the Customer's Ecosystem** section.

Customer Success (Tech Sales)	Summarize the customer's security, accessibility, sovereignty and compliance posture for their platforms and applications: 1. What security and compliance tools are used today across infrastructure, applications, and cloud? 2. What frameworks, standards, required functionalities or policies guide their security and compliance requirements? 3. How do they manage vulnerabilities, monitoring, incident response, and access control? 4. What gaps, challenges, or upcoming audits influence their future security or compliance needs? What is the value of the gaps/risks and what mitigations strategies are available, if any (e.g. manual hardening)? By adding information in this section, you are informing strategic investments, prioritization, and resource allocation across Products and Global Engineering. This includes: • New product security compliance certifications, such as HIPAA, ISO 42001, Common Criteria, and FIPS. • Development and maintenance of new compliance automation profiles and implementation / hardening guides. • Creation of Accessibility Conformance Reports for requirements such as the US's Section 508, EU's European Accessibility Act, and Canada's Accessible Canada Act. • Sovereignty offerings. If you have identified a compliance, security or accessibility requirement that customer has and Red Hat does meet it, state it here - be as specific as possible (include the size of the risk/opportunity for RH, which product and version it relates to etc.)

THIS SECTION IS INTENDED TO BE SHARED AS AN EXECUTIVE SUMMARY INTERNALLY AND WITH CUSTOMERS AND/OR PARTNERS Help Field Text for Customer Success Executive Summary: Copy and answer the following three questions in the Executive Summary section. This section is customer-facing and should be created collaboratively with the customer to establish a mutually agreed plan for realizing value. What outcomes can the customer expect from using Red Hat Technology? This information will be used during customer reviews to bridge the customer's business strategy and objectives outlined in the Account Intelligence section with how Red Hat will collaborate with them and which technologies will be utilized. Include the names of both customer and Red Hat initiative owners. What are the top three risks and recommended mitigations for Red Hat and the customer in achieving these outcomes? This will highlight what both the customer and Red Hat perceive as potential obstacles to achieving the desired outcomes. Examples may include product performance, customer skills, stakeholder engagement, etc. What adoption resources are currently engaged, planned, or needed, and what issues are they addressing for this customer? This information will illustrate who, in addition to the assigned account team (AE, ASA, CSE, etc.), is engaged to help resolve customer adoption risks. Examples may include Services, Partners, Launch Teams, Training and Certification, etc. Please include a brief description of their role or project within the account. Additional resources		

What is the Red Hat's level of engagement in the customer's adoption journey?

Approvals	THIS MULTIPLE-CHOICE QUESTION IS USED FOR REPORTING TO SALES LEADERSHIP AND SPECIALIZED TEAMS. THIS ANSWER IS ALSO USED FOR CUSTOMER SUMMARY. Please select the option that best reflects the level of engagement in the customer's adoption journey: Minimal: The customer prefers to take full responsibility for their adoption journey and only engages when specific assistance is needed. Moderate: The customer engages with the Red Hat account team and utilizes available free or low-cost resources (training, short-term engagements, etc.). Mature: The customer engages deeply with the Red Hat account team and leverages additional paid resources, such as Red Hat consulting services. Third-Party Led: The customer has contracted a third party to manage their adoption journey on their behalf (e.g., consulting firms or partners). Additional resources
